2-PYRIDYL CARBOXAMIDE-CONTAINING SPLEEN TYROSINE KINASE (SYK) INHIBITORS

CROSS REFERENCE TO RELATED APPLICATIONS

This application is a U.S. National Phase application under 35 U.S.C. §371 of PCT Application No. PCT/US2012/058219, filed Oct. 1, 2012, which claims priority under 35 U.S.C. §119(e) from U.S. Provisional Application No. 61/543,539, filed Oct. 5, 2011.

FIELD OF THE INVENTION

The present invention relates to certain 2-pyridyl carboxamide-containing compounds of the Formula (I) (also referred to herein as the “compounds of the Formula (I)” or “compounds of Formula (I)”) which are inhibitors of Spleen Tyrosine Kinase (Syk) kinase activity. The present invention also provides compositions comprising such compounds, and methods of using such compounds for treating conditions or disorders associated with inappropriate Syk activity, in particular in the treatment and prevention of disease states mediated by Syk. Such disease states may include inflammatory, allergic and autoimmune diseases, for example, asthma, chronic obstructive pulmonary disease (COPD), adult respiratory distress syndrome (ARDS), ulcerative colitis, Crohns disease, bronchitis, dermatitis, allergic rhinitis, psoriasis, scleroderma, urticaria, rheumatoid arthritis, idiopathic thrombocytopenic purpura (ITP), multiple sclerosis, cancer, HIV and lupus.

BACKGROUND OF THE INVENTION

Spleen Tyrosine Kinase (Syk) is a protein tyrosine kinase which has been described as a key mediator of immunoreceptor signalling in a host of inflammatory cells including mast cells, B-cells, macrophages and neutrophils. These immunoreceptors, including Fc receptors and the B-cell receptor, are important for both allergic diseases and antibody-mediated autoimmune diseases and thus pharmacologically interfering with Syk could conceivably treat these disorders.

Allergic rhinitis and asthma are diseases associated with hypersensitivity reactions and inflammatory events involving a multitude of cell types including mast cells, eosinophils, T cells and dendritic cells. Following exposure to allergen, high affinity immunoglobulin receptors for IgE and IgG become cross-linked and activate downstream processes in mast cells and other cell types leading to the release of pro-inflammatory mediators and airway spasmogens. In the mast cell, for example, IgE receptor cross-linking by allergen leads to release of mediators including histamine from pre-formed granules, as well as the synthesis and release of newly synthesized lipid mediators including prostaglandins and leukotrienes.

Syk kinase is a non-receptor linked tyrosine kinase which is important in transducing the downstream cellular signals associated with cross-linking Fc_εRI and or Fc_εRI receptors, and is positioned early in the signalling cascade. In mast cells, for example, the early sequence of Fc_εRI signalling following allergen cross-linking of receptor-IgE complexes involves first Lyn (a Src family tyrosine kinase) and then Syk. Inhibitors of Syk activity would therefore be expected to inhibit all downstream signalling cascades thereby alleviating the immediate allergic response and adverse events initiated by the release of pro-inflammatory

2

mediators and spasmogens (Wong et al. 2004, *Expert Opin. Investig. Drugs* (2004) 13 (7) 743-762).

Recently, it has been shown that the Syk kinase inhibitor R112 (Rigel), dosed intranasally in a phase I/II study for the treatment of allergic rhinitis, gave a statistically significant decrease in PGD₂, a key immune mediator that is highly correlated with improvements in allergic rhinorrhea, as well as being safe across a range of indicators, thus providing the first evidence for the clinical safety and efficacy of a topical Syk kinase inhibitor. (Meltzer, Eli O.; Berkowitz, Robert B.; Grossbard, Elliott B. 2005, *Journal of Allergy and Clinical Immunology* 115(4): 791-796). In a more recent phase II clinical trial for allergic rhinitis (ClinicalTrials.gov Identifier NCT0015089), R112 was shown as having a lack of efficacy versus placebo.

Rheumatoid Arthritis (RA) is an auto-immune disease affecting approximately 1% of the population. It is characterised by inflammation of articular joints leading to debilitating destruction of bone and cartilage. Recent clinical studies with Rituximab, which causes a reversible B cell depletion, (J. C. W. Edwards et al. 2004, *New Eng. J. Med.* 350: 2572-2581) have shown that targeting B cell function is an appropriate therapeutic strategy in auto-immune diseases such as RA. Clinical benefit correlates with a reduction in auto-reactive antibodies (or Rheumatoid Factor) and these studies suggest that B cell function and indeed auto-antibody production are central to the ongoing pathology in the disease.

Studies using cells from mice deficient in the Spleen Tyrosine Kinase (Syk) have demonstrated a non-redundant role of this kinase in B cell function. The deficiency in Syk is characterised by a block in B cell development (M. Turner et al. 1995 *Nature* 379: 298-302 and Cheng et al. 1995, *Nature* 378: 303-306). These studies, along with studies on mature B cells deficient in Syk (Kurasaki et al. 2000, *Immunol. Rev.* 176:19-29), demonstrate that Syk is required for the differentiation and activation of B cells. Hence, inhibition of Syk in RA patients is likely to block B cell function, and thereby reduce Rheumatoid Factor production. In addition to the role of Syk in B cell function, and of further relevance to the treatment of RA, is the requirement for Syk activity in Fc receptor (FcR) signalling. FcR activation by immune complexes in RA has been suggested to contribute to the release of multiple pro-inflammatory mediators.

SUMMARY OF THE INVENTION

The present invention provides novel compounds that are potent inhibitors of Syk as well as pharmaceutical compositions containing them. As Syk inhibitors compounds of Formula (I) are useful in the treatment and prevention of diseases and disorders mediated by the Syk protein; such diseases and disorders include, but are not limited to, rheumatoid arthritis, asthma, COPD, cancer and idiopathic thrombocytopenic purpura.

The term "substituted" means that one or more hydrogens on the atoms of the designated are replaced with a selection from the indicated group, provided that the atoms' normal valencies under the existing circumstances are not exceeded, and that the substitution results in a stable compound. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds. By "stable compound" or "stable structure" is meant a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

When any substituent or variable occurs more than one time in any constituent or the compound of Formula (I), its definition on each occurrence is independent of its definition at every other occurrence, unless otherwise indicated.

The term "in purified form," as used herein, refers to the physical state of a compound after the compound is isolated from a synthetic process (e.g., from a reaction mixture), a natural source, or a combination thereof. The term "in purified form," also refers to the physical state of a compound after the compound is obtained from a purification process or processes described herein or well-known to the skilled artisan (e.g., chromatography, recrystallization and the like), in sufficient purity to be characterizable by standard analytical techniques described herein or well-known to the skilled artisan.

It should also be noted that any carbon as well as heteroatom with unsatisfied valences in the text, schemes, examples and tables herein is assumed to have the sufficient number of hydrogen atom(s) to satisfy the valences.

One or more compounds of the invention may exist in unsolvated as well as solvated forms with pharmaceutically

acceptable solvents such as water, ethanol, and the like, and it is intended that the invention embrace both solvated and unsolvated forms. "Solvate" means a physical association of a compound of this invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolatable solvates. Non-limiting examples of suitable solvates include ethanols, methanols, and the like. "Hydrate" is a solvate wherein the solvent molecule is H₂O.

The compounds of Formula (I) may contain one or more stereogenic centers and can thus occur as racemates, racemic mixtures, single enantiomers, diastereomeric mixtures and individual diastereomers. Additional asymmetric centers may be present depending upon the nature of the various substituents on the molecule. Each such asymmetric center will independently produce two optical isomers and it is intended that all of the possible optical isomers and diastereomers in mixtures and as pure or partially purified compounds are included within the ambit of this invention. Any formulas, structures or names of compounds described in this specification that do not specify a particular stereochemistry are meant to encompass any and all existing isomers as described above and mixtures thereof in any proportion. When stereochemistry is specified, the invention is meant to encompass that particular isomer in pure form or as part of a mixture with other isomers in any proportion.

In addition, the prefix "rel", when used in naming a compound that contains two asymmetric carbon atoms, indicates that the relative stereochemistry between the two asymmetric carbon atoms is as described, but that the absolute stereochemistry is unknown. Thus, by way of example, a compound containing two contiguous asymmetric carbon atoms whose chemical name is preceded by the prefix "rel" and which also indicates a "3R,4S" configuration, means that the relationship between the two asymmetric carbon atoms could have the absolute configuration of "(3R,4S)" or the absolute configuration of 3S,4R.

Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods well known to those skilled in the art, such as, for example, by chromatography and/or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereomers and converting (e.g., hydrolyzing) the individual diastereomers to the corresponding pure enantiomers. Also, some of the compounds of Formula (I) may be atropisomers (e.g., substituted biaryls) and are considered as part of this invention. Enantiomers can also be separated by use of chiral HPLC column.

It is also possible that the compounds of Formula (I) may exist in different tautomeric forms, and all such forms are embraced within the scope of the invention.

All stereoisomers (for example, geometric isomers, optical isomers and the like) of the present compounds (including those of the salts and solvates of the compounds as well as the salts, solvates and esters of the prodrugs), such as those which may exist due to asymmetric carbons on various substituents, including enantiomeric forms (which may exist even in the absence of asymmetric carbons), rotameric forms, atropisomers, and diastereomeric forms, are contemplated within the scope of this invention. Individual stereoisomers of the com-

pounds of the invention may, for example, be substantially free of other isomers, or may be admixed, for example, as racemates or with all other, or other selected, stereoisomers. The chiral centers of the present invention can have the S or R configuration as defined by the *IUPAC* 1974 Recommendations.

The compounds of Formula (I) can form salts which are also within the scope of this invention. Reference to a compound of Formula (I) herein is understood to include reference to salts thereof, unless otherwise indicated. The term "salt(s)", as employed herein, denotes acidic salts formed with inorganic and/or organic acids, as well as basic salts formed with inorganic and/or organic bases. In addition, when a compound of Formula (I) contains both a basic moiety, such as, but not limited to a pyridine or imidazole, and an acidic moiety, such as, but not limited to a carboxylic acid, zwitterions ("inner salts") may be formed and are included within the term "salt(s)" as used herein. Such acidic and basic salts used within the scope of the invention are pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable) salts. Salts of the compounds of Formula (I) may be formed, for example, by reacting a compound of Formula (I) with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

Exemplary acid addition salts include acetates, ascorbates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates, camphorsulfonates, fumarates, hydrochlorides, hydrobromides, hydriodides, lactates, maleates, methanesulfonates, naphthalenesulfonates, nitrates, oxalates, phosphates, propionates, salicylates, succinates, sulfates, tartrates, thiocyanates, toluenesulfonates (also known as tosylates) and the like. Additionally, acids which are generally considered suitable for the formation of pharmaceutically useful salts from basic pharmaceutical compounds are discussed, for example, by P. Stahl et al, Camille G. (eds.) *Handbook of Pharmaceutical Salts. Properties, Selection and Use*. (2002) Zurich: Wiley-VCH; S. Berge et al, *Journal of Pharmaceutical Sciences* (1977) 66(1) 1-19; P. Gould, *International J. of Pharmaceutics* (1986) 33 201-217; Anderson et al, *The Practice of Medicinal Chemistry* (1996), Academic Press, New York; and in *The Orange Book* (Food & Drug Administration, Washington, D.C. on their website). These disclosures are incorporated herein by reference.

Exemplary basic salts include ammonium salts, alkali metal salts such as sodium, lithium, and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases (for example, organic amines) such as dicyclohexylamines, t-butyl amines, and salts with amino acids such as arginine, lysine and the like. Basic nitrogen-containing groups may be quarternized with agents such as lower alkyl halides (e.g., methyl, ethyl, and butyl chlorides, bromides and iodides), dialkyl sulfates (e.g., dimethyl, diethyl, and dibutyl sulfates), long chain halides (e.g., decyl, lauryl, and stearyl chlorides, bromides and iodides), aralkyl halides (e.g., benzyl and phenethyl bromides), and others.

The present invention further includes the compounds of Formula (I) in all their isolated forms. For example, the above-identified compounds are intended to encompass all forms of the compounds such as, any solvates, hydrates, stereoisomers, and tautomers thereof.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

In the compounds of generic Formula (I), the atoms may exhibit their natural isotopic abundances, or one or more of the atoms may be artificially enriched in a particular isotope having the same atomic number, but an atomic mass or mass number different from the atomic mass or mass number predominantly found in nature. The present invention is meant to include all suitable isotopic variations of the compounds of generic Formula (I). For example, different isotopic forms of hydrogen (H) include protium (^1H) and deuterium (^2H). Protium is the predominant hydrogen isotope found in nature. Enriching for deuterium may afford certain therapeutic advantages, such as increasing in vivo half-life or reducing dosage requirements, or may provide a compound useful as a standard for characterization of biological samples. Isotopically-enriched compounds within generic Formula (I) can be prepared without undue experimentation by conventional techniques well known to those skilled in the art or by processes analogous to those described in the Schemes and Examples herein using appropriate isotopically-enriched reagents and/or intermediates.

The inappropriate Syk activity referred to herein is any Syk activity that deviates from the normal Syk activity expected in a particular patient.

Inappropriate Syk activity may take the form of, for instance, an abnormal increase in activity, or an aberration in the timing and or control of Syk activity. Such inappropriate activity may result then, for example, from overexpression or mutation of the protein kinase leading to inappropriate or uncontrolled activation.

In a further embodiment, the present invention is directed to methods of regulating, modulating, or inhibiting Syk for the prevention and/or treatment of disorders related to unregulated Syk activity.

Thus, compounds of the present invention can be used to regulate Fc receptor, ITAM, B cell receptor and integrin signaling cascades, as well as the cellular responses elicited through these signaling cascades. Non-limiting examples of cellular responses that may be regulated or inhibited include respiratory burst, cellular adhesion, cellular degranulation, cell spreading, cell migration, phagocytosis, calcium ion flux, platelet aggregation and cell maturation.

Compositions and Administration

While it is possible that, for use in therapy, a compound of Formula (I), as well as pharmaceutically acceptable salts thereof, may be administered as the raw chemical, it is possible to present the active ingredient as a pharmaceutical composition. Accordingly, the invention further provides a pharmaceutical composition, which comprises a compound of Formula (I) and pharmaceutically acceptable salts thereof, and a pharmaceutically acceptable carrier. The compounds of the Formula (I) and pharmaceutically acceptable salts thereof, are as described above. The carriers must be acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof. In accordance with another aspect of the invention there is also provided a process for the preparation of a pharmaceutical composition including admixing a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, with one or more pharmaceutically acceptable carriers.

Pharmaceutical compositions of the present invention may be presented in unit dose forms containing a predetermined amount of active ingredient per unit dose. Such a unit may contain, for example, 5 μ g to 1 g, preferably 1 mg to 700 mg, more preferably 5 mg to 100 mg of a compound of the Formula (I), depending on the condition being treated, the route of administration and the age, weight and condition of the patient. Such unit doses may therefore be administered more than once a day. Preferred unit dosage compositions are those containing a daily dose or sub-dose (for administration more than once a day), as herein above recited, or an appropriate fraction thereof, of an active ingredient. Furthermore, such pharmaceutical compositions may be prepared by any of the methods well known in the pharmacy art.

Pharmaceutical compositions of the present invention may be adapted for administration by any appropriate route, for example by the oral (including buccal or sublingual), rectal, topical, inhaled, nasal, ocular, or parenteral (including intravenous and intramuscular) route. Such compositions may be prepared by any method known in the art of pharmacy, for example by bringing into association the active ingredient with the carrier(s) or excipient(s). Dosage forms include tablets, troches, dispersions, suspensions, solutions, capsules, creams, ointments, aerosols, and the like.

In a further embodiment, the present invention provides a pharmaceutical composition adapted for administration by the oral route, for treating, for example, rheumatoid arthritis.

In a further embodiment, the present invention provides a pharmaceutical composition adapted for administration by the nasal route, for treating, for example, allergic rhinitis.

In a further embodiment, the present invention provides a pharmaceutical composition adapted for administration by the inhaled route, for treating, for example, asthma, COPD or ARDS.

In a further embodiment, the present invention provides a pharmaceutical composition adapted for administration by the inhaled route, for treating, for example, asthma or COPD.

In a further embodiment, the present invention provides a pharmaceutical composition adapted for administration by the ocular route, for treating, diseases of the eye, for example, conjunctivitis.

In a further embodiment, the present invention provides a pharmaceutical composition adapted for administration by the parenteral (including intravenous) route, for treating, for example, cancer.

Pharmaceutical compositions of the present invention which are adapted for oral administration may be presented as discrete units such as capsules or tablets; powders or granules; solutions or suspensions in aqueous or non-aqueous liquids; edible foams or whips; or oil-in-water liquid emulsions or water-in-oil liquid emulsions.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Powders are prepared by comminuting the compound to a suitable fine size and mixing with a similarly comminuted pharmaceutical carrier such as an edible carbohydrate, as, for example, starch or mannitol. Flavoring, preservative, dispersing and coloring agent can also be present.

Capsules are made by preparing a powder mixture, as described above, and filling formed gelatin sheaths. Glidants and lubricants such as colloidal silica, talc, magnesium stearate, calcium stearate or solid polyethylene glycol can be added to the powder mixture before the filling operation. A disintegrating or solubilizing agent such as agar-agar, cal-

cium carbonate or sodium carbonate can also be added to improve the availability of the medicament when the capsule is ingested.

Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum and the like. Tablets are formulated, for example, by preparing a powder mixture, granulating or slugging, adding a lubricant and disintegrant and pressing into tablets. A powder mixture is prepared by mixing the compound, suitably comminuted, with a diluent or base as described above, and optionally, with a binder such as carboxymethylcellulose, an algininate, gelatin, or polyvinyl pyrrolidone, a solution retardant such as paraffin, a resorption accelerator such as a quaternary salt and/or an absorption agent such as bentonite, kaolin or dicalcium phosphate. The powder mixture can be granulated by wetting with a binder such as syrup, starch paste, acacia mucilage or solutions of cellulosic or polymeric materials and forcing through a screen. As an alternative to granulating, the powder mixture can be run through the tablet machine and the result is imperfectly formed slugs broken into granules. The granules can be lubricated to prevent sticking to the tablet forming dies by means of the addition of stearic acid, a stearate salt, talc or mineral oil. The lubricated mixture is then compressed into tablets. The compounds of the present invention can also be combined with a free flowing inert carrier and compressed into tablets directly without going through the granulating or slugging steps. A clear or opaque protective coating consisting of a sealing coat of shellac, a coating of sugar or polymeric material and a polish coating of wax can be provided. Dyestuffs can be added to these coatings to distinguish different unit dosages.

Oral fluids such as solution, syrups and elixirs can be prepared in dosage unit form so that a given quantity contains a predetermined amount of the compound. Syrups can be prepared by dissolving the compound in a suitably flavored aqueous solution, while elixirs are prepared through the use of a non-toxic alcoholic vehicle. Suspensions can be formulated by dispersing the compound in a non-toxic vehicle. Solubilizers and emulsifiers such as ethoxylated isostearyl alcohols and polyoxy ethylene sorbitol ethers, preservatives, flavor additive such as peppermint oil or natural sweeteners or saccharin or other artificial sweeteners, and the like can also be added.

Where appropriate, dosage unit compositions for oral administration can be microencapsulated. The formulation can also be prepared to prolong or sustain the release, for example, by coating or embedding particulate material in polymers, wax or the like.

The compounds of Formula (I) and pharmaceutically acceptable salts thereof can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine or phosphatidylcholines.

The compounds of Formula (I) and pharmaceutically acceptable salts thereof may also be delivered by the use of monoclonal antibodies as individual carriers to which the

compound molecules are coupled. The compounds may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamide-phenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxide-polylysine substituted with palmitoyl residues. Furthermore, the compounds may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates and cross-linked or amphiphilic block copolymers of hydrogels.

Dosage forms for inhaled administration may conveniently be formulated as aerosols or dry powders.

For compositions suitable and/or adapted for inhaled administration, it is preferred that the compound or salt of Formula (I) is in a particle-size-reduced form, and more preferably the size-reduced form is obtained or obtainable by micronisation. The preferable particle size of the size-reduced (e.g., micronised) compound or salt or solvate is defined by a D50 value of about 0.5 to about 10 microns (for example as measured using laser diffraction).

Aerosol formulations, e.g., for inhaled administration, can comprise a solution or fine suspension of the active substance in a pharmaceutically acceptable aqueous or non-aqueous solvent. Aerosol formulations can be presented in single or multidose quantities in sterile form in a sealed container, which can take the form of a cartridge or refill for use with an atomising device or inhaler. Alternatively the sealed container may be a unitary dispensing device such as a single dose nasal inhaler or an aerosol dispenser fitted with a metering valve (metered dose inhaler) which is intended for disposal once the contents of the container have been exhausted.

Where the dosage form comprises an aerosol dispenser, it preferably contains a suitable propellant under pressure such as compressed air, carbon dioxide or an organic propellant such as a hydrofluorocarbon (HFC). Suitable HFC propellants include 1,1,1,2,3,3,3-heptafluoropropane and 1,1,1,2-tetrafluoroethane. The aerosol dosage forms can also take the form of a pump-atomiser. The pressurised aerosol may contain a solution or a suspension of the active compound. This may require the incorporation of additional excipients e.g., co-solvents and/or surfactants to improve the dispersion characteristics and homogeneity of suspension formulations. Solution formulations may also require the addition of co-solvents such as ethanol. Other excipient modifiers may also be incorporated to improve, for example, the stability and/or taste and/or fine particle mass characteristics (amount and/or profile) of the formulation.

For pharmaceutical compositions suitable and/or adapted for inhaled administration, it is preferred that the pharmaceutical composition is a dry powder inhalable composition. Such a composition can comprise a powder base such as lactose, glucose, trehalose, mannitol or starch, the compound of Formula (I) or salt or solvate thereof (preferably in particle-size-reduced form, e.g., in micronised form), and optionally a performance modifier such as L-leucine or another amino acid, and/or metals salts of stearic acid such as magnesium or calcium stearate. Preferably, the dry powder inhalable composition comprises a dry powder blend of lactose and the compound of Formula (I) or salt thereof. The lactose is preferably lactose hydrate e.g., lactose monohydrate and/or is preferably inhalation-grade and/or fine-grade lactose. Preferably, the particle size of the lactose is defined by 90% or more (by weight or by volume) of the lactose particles being less than 1000 microns (micrometers) (e.g., 10-1000 microns e.g., 30-1000 microns) in diameter, and/or 50% or more of the

lactose particles being less than 500 microns (e.g., 10-500 microns) in diameter. More preferably, the particle size of the lactose is defined by 90% or more of the lactose particles being less than 300 microns (e.g., 10-300 microns, e.g., 50-300 microns) in diameter, and/or 50% or more of the lactose particles being less than 100 microns in diameter. Optionally, the particle size of the lactose is defined by 90% or more of the lactose particles being less than 100-200 microns in diameter, and/or 50% or more of the lactose particles being less than 40-70 microns in diameter. It is preferable that about 3 to about 30% (e.g., about 10%) (by weight or by volume) of the particles are less than 50 microns or less than 20 microns in diameter. For example, without limitation, a suitable inhalation-grade lactose is E9334 lactose (10% fines) (Borculo Domo Ingredients, Hanzeplein 25, 8017 J D Zwolle, Netherlands).

Optionally, in particular for dry powder inhalable compositions, a pharmaceutical composition for inhaled administration can be incorporated into a plurality of sealed dose containers (e.g., containing the dry powder composition) mounted longitudinally in a strip or ribbon inside a suitable inhalation device. The container is rupturable or peel-openable on demand and the dose of e.g., the dry powder composition can be administered by inhalation via the device such as the DISKUS® device (GlaxoSmithKline). Other dry powder inhalers are well known to those of ordinary skill in the art, and many such devices are commercially available, with representative devices including Aerolizer® (Novartis), Airmax™ (IVAX), ClickHaler® (Innovata Biomed), Diskhaler® (GlaxoSmithKline), Accuhaler (GlaxoSmithKline), Easyhaler® (Orion Pharma), Eclipse™ (Aventis), FlowCaps® (Hovione), Handihaler® (Boehringer Ingelheim), Pulvinal® (Chiesi), Rotahaler® (GlaxoSmithKline), Skyehaler™ or Certihaler™ (SkyePharma), Twisthaler (Merck), Turbuhaler® (AstraZeneca), Ultrahaler® (Aventis), and the like.

Dosage forms for ocular administration may be formulated as solutions or suspensions with excipients suitable for ophthalmic use.

Dosage forms for nasal administration may conveniently be formulated as aerosols, solutions, drops, gels or dry powders.

Pharmaceutical compositions adapted for administration by inhalation include fine particle dusts or mists, which may be generated by means of various types of metered, dose pressurised aerosols, nebulizers or insufflators.

For pharmaceutical compositions suitable and/or adapted for intranasal administration, the compound of Formula (I) or a pharmaceutically acceptable salt or solvate thereof may be formulated as a fluid formulation for delivery from a fluid dispenser. Such fluid dispensers may have, for example, a dispensing nozzle or dispensing orifice through which a metered dose of the fluid formulation is dispensed upon the application of a user-applied force to a pump mechanism of the fluid dispenser. Such fluid dispensers are generally provided with a reservoir of multiple metered doses of the fluid formulation, the doses being dispensable upon sequential pump actuations. The dispensing nozzle or orifice may be configured for insertion into the nostrils of the user for spray dispensing of the fluid formulation into the nasal cavity. A fluid dispenser of the aforementioned type is described and illustrated in WO-A-2005/044354, the entire content of which is hereby incorporated herein by reference. The dispenser has a housing which houses a fluid discharge device having a compression pump mounted on a container for containing a fluid formulation. The housing has at least one finger-operable side lever which is movable inwardly with

29

respect to the housing to cam the container upwardly in the housing to cause the pump to compress and pump a metered dose of the formulation out of a pump stem through a nasal nozzle of the housing. A particularly preferred fluid dispenser is of the general type illustrated in FIGS. 30-40 of WO-A-2005/044354.

A therapeutically effective amount of a compound of the present invention will depend upon a number of factors including, for example, the age and weight of the animal, the precise condition requiring treatment and its severity, the nature of the formulation, and the route of administration, and will ultimately be at the discretion of the attendant physician or veterinarian. However, an effective amount of a compound of Formula (I) for the treatment of diseases or conditions associated with inappropriate Syk activity, will generally be in the range of 5 µg to 100 mg/kg body weight of recipient

Methods of Preparing the Compounds of Formula (I)

The compounds of this invention may be made by a variety of methods, including standard chemistry. Any previously defined variable will continue to have the previously defined meaning unless otherwise indicated. Illustrative general synthetic methods are set out below and then specific compounds of the Formula (I) are prepared in the Examples.

Compounds of general Formula (I) may be prepared by methods known in the art of organic synthesis as set forth in part by the following synthesis schemes. In all of the schemes described below, it is well understood that protecting groups for sensitive or reactive groups are employed where necessary in accordance with general principles of chemistry. Protecting groups are manipulated according to standard methods of organic synthesis (T. W. Green and P. G. M. Wuts (1991) *Protecting Groups in Organic Synthesis*, John Wiley & Sons). These groups are removed at a convenient stage of the compound synthesis using methods that are readily apparent to those skilled in the art. The selection of protecting groups as well as the reaction conditions and order of reaction steps shall be consistent with the preparation of compounds of Formula (I). Those skilled in the art will recognize whether a stereocenter exists in compounds of Formula (I). Accordingly, the present invention includes all possible stereoisomers and includes not only mixtures of stereoisomers (such as racemic compounds) but the individual stereoisomers as well. When a compound is desired as a single enantiomer, it may be obtained by stereospecific synthesis or by resolution of the final product or any convenient intermediate. Resolution of the final product, an intermediate, or a starting material may be effected by any suitable method known in the art. See, for example, *Stereochemistry of Organic Compounds* by E. L. Eliel, S. H. Wilen, and L. N. Mander (Wiley-Interscience, 1994).

 General Methods
 Compounds of the Formula (I) can be prepared according to one of the synthetic schemes procedures set forth in Schemes 1-5 below, and/or by methods similar to those described in the Examples below.

SCHEME 1

Compounds of structural subtype A (wherein R_{S1} - R_{S4} are various substituents on the ethylenediamine moiety and Ar are various heteroaryl moieties) are prepared from substituted pyridine-2-carbonitriles (A5) (wherein R_{S5} is an alkylamino protecting group) by one of the following methods: a) hydrolysis of the nitrile, or b) acidic deprotection of the alkylamino protecting group followed by hydrolysis of the nitrile, or c) hydrolysis of the nitrile followed by acidic deprotection of the alkylamino protecting group. The substituted pyridine-2-carbonitriles (A5) are prepared by the palladium-mediated coupling of an arylamine with substituted 3-bromopyridine-2-carbonitriles (A3), which in turn are prepared by either the reaction of 3-bromo-5-fluoropyridine-2-carbonitrile (A1) with substituted diamines (A2) via an S_NAr reac-

tion or, alternatively, from the reaction of 3,5-dibromopyridine-2-carbonitrile (A4) with substituted diamines (A2) via a palladium mediated coupling. The substituted pyridine-2-carbonitriles (A5) are also prepared by the palladium-mediated coupling of substituted diamines (A2) with substituted 5-bromopyridine-2-carbonitriles (A7), which are prepared from the reaction of 5-bromo-3-fluoropyridine-2-carbonitrile (A6) with arylamines via S_NAr conditions. Compounds of structural subtype A also are obtained by the palladium-mediated coupling of substituted diamines (A2) with protected carboxamides (A8) followed by acidic deprotection. The protected carboxamides (A8) (wherein R_{S7} is a carboxamido protecting group) are prepared by the hydrolysis of the carbonitriles (A7) followed by acid catalyzed reaction with the desired alcohol.

38

15

A shown in Scheme 2, compounds of structural subtype (B) are prepared from substituted pyridine-2-carbonitriles (B10) by either (a) acidic deprotection of the alkylamino protecting group followed by hydrolysis of the nitrile, or (b) hydrolysis of the nitrile followed by acidic deprotection of the alkylamino protecting group. Substituted pyridine-2-carbonitriles (B10) are prepared by the palladium-mediated reaction of aryl boronic acids with the 5-bromopyridine precursors (B9), which, in turn, are formed by the reaction of substituted 3-bromopyridine-2-carbonitriles (A3) with

5-bromo-6-methylpyridin-2-amine under palladium-mediated conditions. Compounds of structural subtype (C) are formed from the acidic deprotection of substituted pyridine-2-carboxamides (C12) (wherein R_{S6} is an alkyl group). The substituted pyridine-2-carboxamides (C12) are prepared from the reaction of the phenols (C11) with various alcohols under Mitsunobu conditions. The phenols (C11) are formed from the reaction of the 5-bromopyridine precursors (B9) with a hydroxide source via palladium-mediated conditions.

SCHEME 3

39

40

As shown in Scheme 3, compounds of structural subtype (D) are prepared from substituted pyridine-2-carbonitriles (D14) by either (a) acidic deprotection of the alkylamino protecting group followed by hydrolysis of the nitrile, or (b) hydrolysis of the nitrile followed by acidic deprotection of the alkylamino protecting group. Substituted pyridine-2-carbonitriles (D14) are prepared by the palladium-mediated reaction of aryl boronic acids with the 4-chloropyridine precursors (D13), which are formed by the reaction of substituted 3-bromopyridine-2-carbonitriles (A3) with 4-chloro-6-meth-

ylpyridin-2-amine under palladium-mediated conditions. Compounds of structural subtype (E) are formed from the acidic deprotection of substituted pyridine-2-carboxamides (E16). The substituted pyridine-2-carboxamides (E16) are prepared from the reaction of the phenols (E15) with various alcohols under Mitsunobu conditions. The phenols (E15) are formed from the reaction of the 4-chloropyridine precursors (D13) with a hydroxide source via palladium-mediated conditions. Compounds of formula (F) are formed by the acidic deprotection of phenols (E15).

SCHEME 4

As shown in Scheme 4, compounds of structural subtype G are prepared from the sulfonamides (G19) by acidic deprotection of the alkylamino protecting group followed by hydrolysis of the nitrile. The sulfonamides (G19) are synthesized from the substituted 5-amino-pyridine-2-carbonitriles (H18) by reaction with a sulfonylchloride. The substituted 5-amino-pyridine-2-carbonitriles (H18), in turn, are prepared from the substituted 5-bromo-pyridine-2-carbonitriles (A7) via a palladium-mediated coupling with 2,4-dimethoxyben-

zylamine followed by an acidic deprotection. Alternatively, substituted 5-amino-pyridine-2-carbonitriles (H18) are reacted with acyl chlorides (wherein R_{57} is alkyl) and then subjected to hydrolysis conditions to provide compounds of structural subtype (H). Compounds of structural subtype (K) also are prepared from substituted 5-amino-pyridine-2-carbonitriles (H18) by hydrolysis of the nitrile. Compounds of structural subtype (J) (wherein R_{58} is alkyl) are prepared from compounds of formula (K) by reaction with alkylisocyanates.

SCHEME 5

-continued

As shown in Scheme 5, compounds of structural subtype (L) are prepared from the pyridylcarboxylates (L21) by standard amide coupling with an alkylamine (wherein R_{59} and R_{510} are independent H or alkyl) followed by acid deprotection of the alkylamino protecting group. The pyridylcarboxylates (L21) are prepared from substituted 3-bromopyridine-2-carbonitriles (A3) by a palladium-mediated coupling with ethyl 6-amino-2-methylpyridine-3-carboxylate followed by a global hydrolysis of the nitrile and ethyl carboxylate. Alternatively, the pyridylcarboxylates (L21) are subjected to acidic deprotection conditions to afford compounds of structural subtype (M).

Compounds of structural subtypes A-M are prepared according to the procedures described in the Schemes and Examples herein, using appropriate materials, and are further exemplified by the following specific examples. The compounds exemplified are illustrative of the invention and are not, however, to be construed as limiting the scope of the invention in any manner. The examples further illustrate details for the preparation of the compounds of the present invention. Those skilled in the art will readily understand that known variations of protecting groups, of reagents, as well as of the conditions and processes of the following preparative procedures, can be used to prepare these compounds. It is also understood that whenever a chemical reagent is not commercially available, such a chemical reagent can be readily prepared by those skilled in the art by either following or adapting known methods described in the literature. All temperatures are degrees Celsius unless otherwise noted. Mass spectra (MS) were measured either by electrospray ion-mass spectroscopy (ESMS) or by atmospheric pressure chemical ionization mass spectroscopy (ESI).

For ease of reference, various moieties are referred in the Examples below as "A" moieties, "B" moieties, "E" moieties and the "pyridylcarboxamide" moiety. These moieties are illustrated in the structural formula below.

The starting materials and reagents used in preparing compounds described are either available from commercial suppliers or were prepared by literature methods known to those skilled in the art.

These examples are being provided to further illustrate the present invention. They are for illustrative purposes only; the scope of the invention is not to be considered limited in any way thereby.

Where mass spectral (MS) data are presented in the examples below, analysis was performed using an Agilent Technologies 6120 quadrupole LC/MS. Resolution of enantiomers was typically performed using supercritical fluid chromatography utilizing a Chiral Technologies AD, AD-H, IB-H, or IC-H column (particle size of 5 or 10 micron stationary phase) with a mobile phase of CO_2 and a lower alcohol and/or THF.

Preparative Example 1.1

tert-butyl {(1S,2R)-2-[(5-bromo-6-cyanopyridin-3-yl)amino]cyclohexyl}carbamate

PrepEx 1.1

This example describes the procedure for conversion of (A1) to (A3) as shown in Scheme 1. Tert-butyl [(1S,2R)-2-aminocyclohexyl]carbamate was purchased from Small Molecules, Inc. (CAS: 365996-30-1, Hoboken, N.J.). DIPEA (18.5 mL, 106 mmol) and tert-butyl [(1S,2R)-2-aminocyclohexyl]carbamate (17.7 g, 82.7 mmol) were added to 3-bromo-5-fluoropyridine-2-carbonitrile (Frontier Scientific; CAS: 950670-18-5, Logan, Utah) (16.4 g, 81.6 mmol) dissolved in NMP (16.3 mL) in a 150 mL sealed tube. The reaction was heated to 120° C. for 24 hours before cooling to ambient temperature. Hydrochloric acid (1.0 M in water, 100 mL, 100 mmol) was added. Dichloromethane was then added drop-

Example 2

Conversions from Scheme 1—Conversion of A7 to Structural Subtype A

The preparation in this example describes the procedure for conversion of A7 to compounds of structural subtype A.

Example 2.1

5-{{[2-amino-3-(methylamino)-3-oxopropyl]amino}-3-[(4,6-dimethylpyridin-2-yl)amino]pyridine-2-carboxamide

Step 1: Dioxane (1.65 ml) was added to a nitrogen purged flask containing 5-bromo-3-[(4,6-dimethylpyridin-2-yl)

amino]pyridine-2-carbonitrile (PrepEx 1.4) (100 mg, 0.330 mmol), tert-butyl 3-amino-1-(methylamino)-1-oxopropan-2-ylcarbamate (72 mg, 0.33 mmol), Xantphos (19 mg, 0.033 mmol), Pd₂(dba)₃ (24 mg, 0.026 mmol) and cesium carbonate (215 mg, 0.660 mmol). Nitrogen was bubbled through the reaction mixture for 5 minutes. The reaction vessel was then sealed and heated at 100° C. for 2 hours. The reaction mixture was cooled to room temperature, filtered through CELITE, and the filter cake was washed with ethyl acetate (10 mL). The filtrate was concentrated under reduced pressure. The residue was purified by silica gel chromatography (0-5% methanol/ethyl acetate, linear gradient) to afford tert-butyl [3-({6-cyano-5-[(4,6-dimethylpyridin-2-yl)amino]pyridin-3-yl}amino)-1-(methylamino)-1-oxopropan-2-yl]carbamate. MS ESI calc'd. for C₂₂H₃₀N₇O₃ [M+H]⁺ 440. found 440.

Step 2: TFA (1.0 ml, 13 mmol) was added to a solution of tert-butyl [3-({6-cyano-5-[(4,6-dimethylpyridin-2-yl)amino]pyridin-3-yl}amino)-1-(methylamino)-1-oxopropan-2-yl]carbamate (72 mg, 0.16 mmol) in DCM (2 ml) at room temperature. After 30 minutes, the reaction mixture was concentrated under reduced pressure to afford 3-({6-cyano-5-[(4,6-dimethylpyridin-2-yl)amino]pyridin-3-yl}amino)-N-methylalaninamide. The material was used in the next step without purification. MS ESI calc'd. for C₁₇H₂₂N₇O [M+H]⁺ 340. found 340.

Step 3: To a solution of 3-({6-cyano-5-[(4,6-dimethylpyridin-2-yl)amino]pyridin-3-yl}amino)-N-methylalaninamide (56 mg, 0.16 mmol) in DMSO (0.8 mL) were added sodium hydroxide (6.0 M in water, 0.14 mL, 0.84 mmol) and hydrogen peroxide (30% w/w in water, 0.167 mL, 1.6 mmol).

137

The reaction mixture was stirred at room temperature for 2.5 hours, then additional sodium hydroxide (6.0 M in water, 0.10 mL, 0.60 mmol) and hydrogen peroxide (30% w/w in water, 0.125 mL, 1.2 mmol) were added. After 12 hours, the reaction mixture was acidified with hydrochloric acid (2.0 M in water, 0.66 mL, 1.3 mmol) and purified by reverse phase HPLC (acetonitrile/water with 0.1% TFA, linear gradient) to afford 5-[[2-amino-3-(methylamino)-3-oxopropyl]amino]-3-[(4,6-dimethylpyridin-2-yl)amino]pyridine-2-carboxamide TFA

Conversions from Scheme 3—Conversion of D13 to Structural Subtype D

The preparation in this example describes the procedure for conversion of D13 to compounds of structural subtype D as shown in Scheme 3.

Example 4.1

5-[[[(1R,2S)-2-aminocyclohexyl]amino]-3-[(6-methyl-4-phenylpyridin-2-yl)amino]pyridine-2-carboxamide

Step 1: Dioxane (1.1 mL), phenylboronic acid (27 mg, 0.22 mmol), and potassium phosphate tribasic (70 mg, 0.33 mmol) were added to a nitrogen purged flask containing tert-butyl [(1S,2R)-2-(5-[(4-chloro-6-methylpyridin-2-yl)amino]-6-cyanopyridin-3-yl)amino)cyclohexyl]carbamate (PrepEx 1.7) (50 mg, 0.11 mmol). The flask was purged and flushed with nitrogen, and then PdCl₂(dppf)-CH₂Cl₂ (9 mg, 0.01 mmol) was added. The flask was purged with nitrogen, sealed, and heated to 90° C. for 2 hours. The reaction mixture was cooled to room temperature, diluted with 10% aqueous sodium bicarbonate (10 mL) and extracted with ethyl acetate (10 mL). The organics were dried over sodium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by chromatography on silica gel (10-50% ethyl acetate/hexanes, linear gradient) to afford tert-butyl (1S,2R)-2-(6-cyano-5-(6-methyl-4-phenylpyridin-2-ylamino)pyridin-3-ylamino)cyclohexylcarbamate. MS ESI calc'd. for C₂₉H₃₅N₆O₂ [M+H]⁺ 499. found 499.

Step 2: TFA (1.0 mL, 13 mmol) was added to a solution of tert-butyl (1S,2R)-2-(6-cyano-5-(6-methyl-4-phenylpyridin-2-ylamino)pyridin-3-ylamino)cyclohexylcarbamate (24 mg, 0.048 mmol) in DCM (2 mL). The reaction mixture was stirred for 30 minutes at room temperature. The reaction mixture was concentrated under reduced pressure to afford 5-((1R,2S)-2-aminocyclohexylamino)-3-(6-methyl-4-phenylpyridin-2-ylamino)picolinonitrile. The material was used in the next step without further purification. MS ESI calc'd. for C₂₄H₂₇N₆ [M+H]⁺ 399. found 399.

161

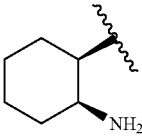

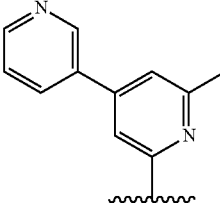

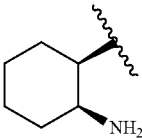

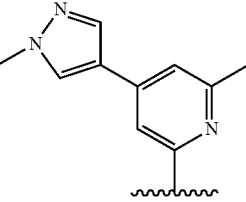

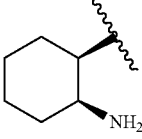

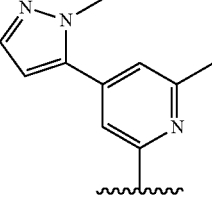

Step 3: 5-((1R,2S)-2-aminocyclohexylamino)-3-(6-methyl-4-phenylpyridin-2-ylamino)picolinonitrile (19 mg, 0.048 mmol) was dissolved in DMSO (0.25 mL), and then sodium hydroxide (6.0 M in water, 0.040 mL, 0.24 mmol) and hydrogen peroxide (30% w/w solution in water, 0.050 mL, 0.49 mmol) were added. The reaction mixture was stirred at room temperature for 2.5 hours. Additional sodium hydroxide (6.0 M in water, 0.010 mL, 0.060 mmol) and hydrogen peroxide (30% w/w solution in water, 0.012 mL, 0.12 mmol) were added and the reaction mixture was stirred an additional 5 hours. The reaction mixture was acidified with hydrochloric acid (2.0 M in water, 0.14 mL, 0.28 mmol), and directly

Biological Assay
Homogeneous Time-Resolved Fluorescence (HTRF) Assay for the Recombinant Human Syk Enzyme

A recombinant GST-hSYK fusion protein was used to measure potency of compounds to inhibit human Syk activity. The recombinant human GST-SYK (Carna Biosciences #08-

183

176) (5 pM final concentration) was incubated with various concentrations of the inhibitor diluted in DMSO (0.1% final concentration) for 10 minutes at room temperature in 15 mM Tris-HCl (pH 7.5), 0.01% tween 20, 2 mM DTT in 384 well plate format. To initiate the reaction the biotinylated substrate peptide (250 nM final concentration) that contains the phosphorylation site for Syk was added with magnesium (5 mM final concentration) and ATP (25 μ M final concentration). Final volume of the reaction was 10 μ L. Phosphorylation of the peptide was allowed to proceed for 45 minutes at room temperature. To quench the reaction and detect the phosphorylated product, 2 nM of a Europium-anti-phosphotyrosine antibody (Perkin Elmer #AD0161) and 70 nM SA-APC (Perkin-Elmer #CR130-100) were added together in 15 mM Tris pH 7.5, 40 mM EDTA, 0.01% tween 20. Final volume of the quenching solution was 10 μ L. The resulting HTRF signal was measured after 30 minutes on an EnVision (Perkin-Elmer) reader using a time-resolved fluorescence protocol. IC₅₀ was determined following 10-dose titration (10 μ M to 0.508 nM) and four parameter logistic curve fitting using an assay data analyzer. Table 1 below lists activity for representative compounds of the invention whereby the IC₅₀ values are rated "A" for IC₅₀ values <10 nM, "B" for IC₅₀ values between 10 nM and 100 nM, "C" for IC₅₀ values between 100 nM and 1,000 nM, and "D" for IC₅₀ values between 1,000 nM and 10,000 nM.
